

START UP SURVIVORS GUIDE TO VSQ4 4.1:

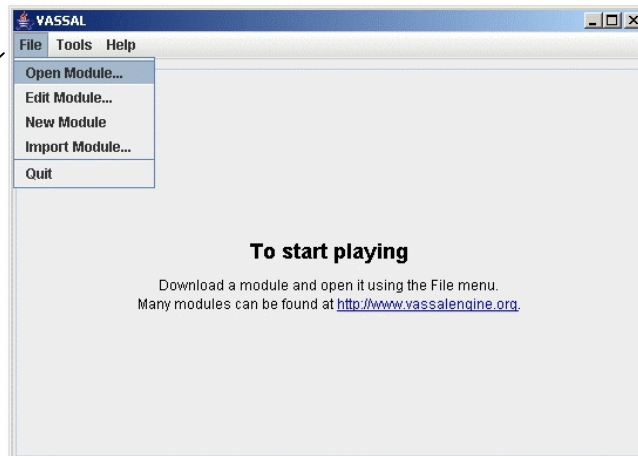

1. Download and *Unzip* the VSQ41.zip file:
2. Download and install VASSAL version 3.1 (or higher) from the Vassalengine.org website.
3. Run VASSAL 3.1+ from the desktop Icon.
4. The below window should appear after start-up:

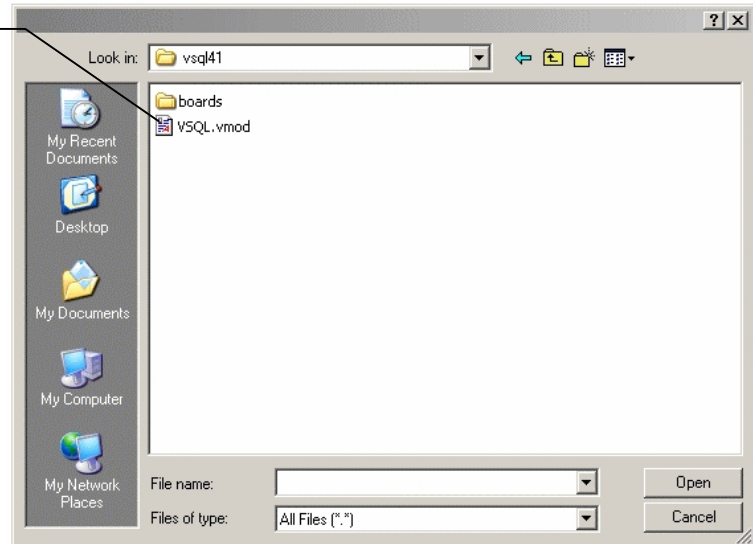

To open and install a module:

Select 'File' from the menu which appears, scroll down and select and click 'Open Module'

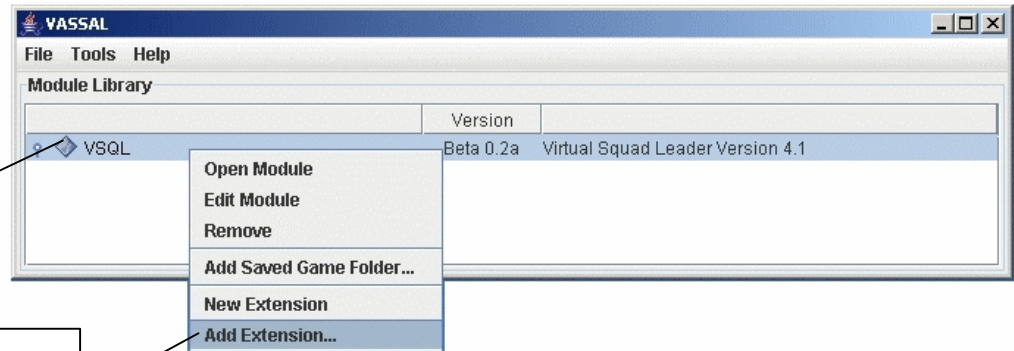

Browse to the directory folder with the **VSQl.vmod** file and select it and press 'Open'.

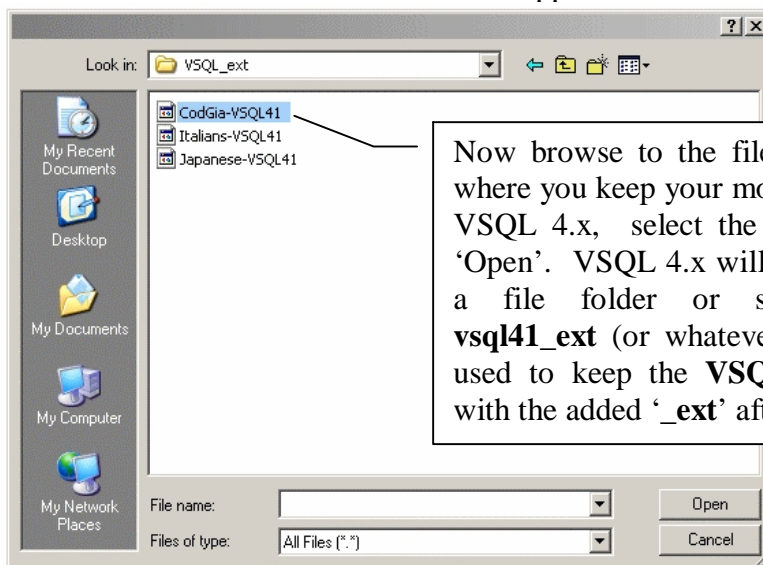

Now we can add any Module Extensions:

Right-click the diamond

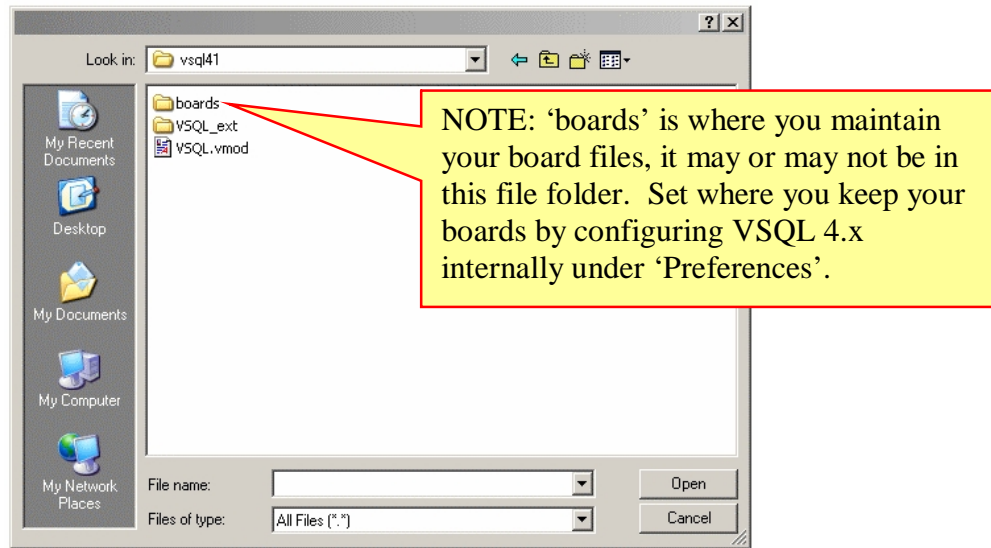

From the menu which appears, scroll down, then select and click 'Add Extension'.

A new window appears:

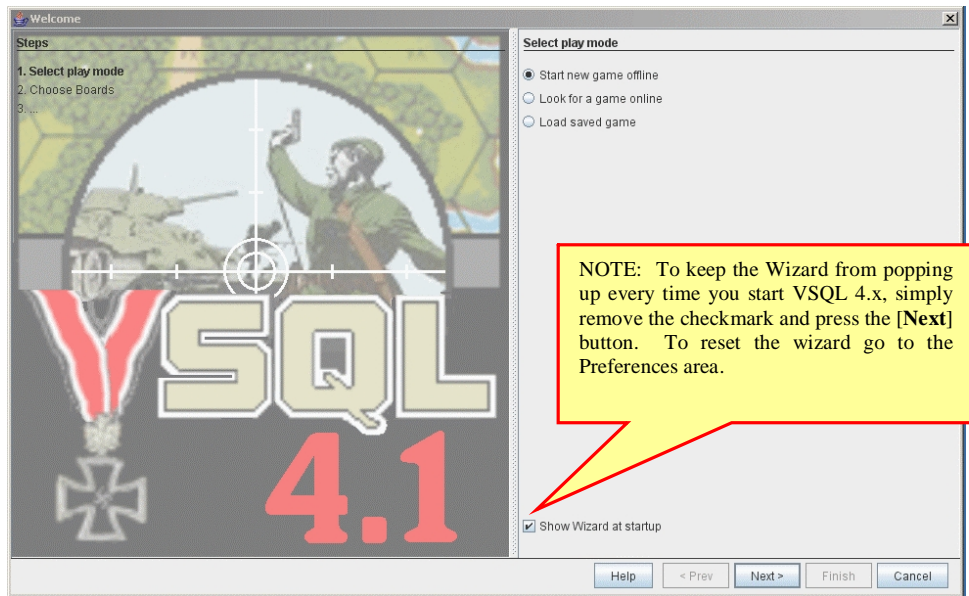

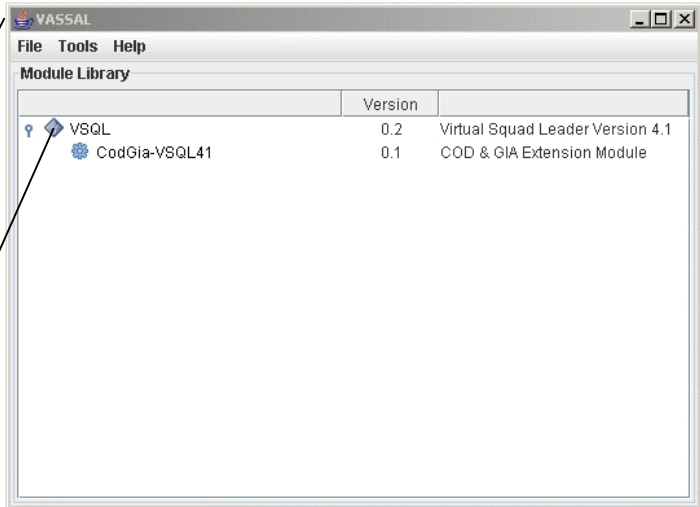

Now browse to the file folder or directory where you keep your module extension(s) for VSQl 4.x, select the extension and press 'Open'. VSQl 4.x will automatically create a file folder or sub-directory called **vsq41_ext** (or whatever filename which is used to keep the **VSQl.vmod** file in but with the added '_ext' after it).

Your VSQ 4.1 folder/directory should now look something like this:

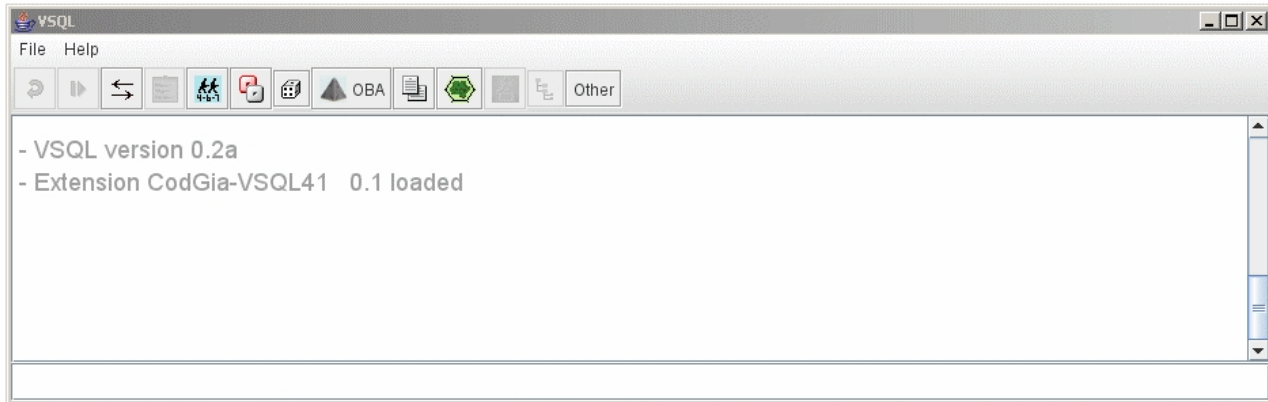

You should still have the VASSAL 3.1 main menu window still open on your screen. If not, start up VASSAL 3.1 and you should see the screen at right.

You can now begin VSQ 4.x by clicking on the diamond. You can also add other module files of other games for easy startups, thereby clearing or reducing the number of icons on your desktop.

If you followed directions carefully, you should now see this! If you do, congratulations!

You can still follow the directions in the VSQL-3.x Survival Guide, 2nd Ed, to learn how to set up VSQL 4.
